CareerConnect | AI Usage Log | Sprint 1

Responsible Person: Candys Eve Mekoupou Eko

Project: SOEN 341, CareerConnect-GroupA

Documentation basis: AI-assisted work discussed in ChatGPT. Review each entry and add direct chat links and repository evidence before submission. These entries do not claim actions or outcomes that were not confirmed.

AI Usage Log: Entry #01

Task: Product backlog and user story development

Purpose of AI Use: Brainstorming, requirements analysis, and backlog documentation

Chat Link: [CareerConnect]

AI-Suggested Content: Drafted prompts for 25 to 30 Agile user stories covering students, recruiters, advisors, and administrators. Proposed acceptance criteria, priorities, story points, dependencies, and technical tasks, including AI Career Match and Skill Gap Analysis.

Validation: Compared proposed stories with the CareerConnect project scope and sprint requirements. Exact final issue set and acceptance criteria require checking against the GitHub backlog.

Decision: Used AI as a drafting and structuring aid; final scope and prioritization remain team decisions.

Reflection: AI helped translate broad feature ideas into actionable backlog items. Generated estimates and dependencies still require human review.

Responsible Person: Candys Eve Mekoupou Eko

Prompt:

Generate 25 - 30 Agile user stories for CareerConnect, a career networking and recruitment platform for students, recruiters/employers, career advisors, and admins, using: "As a [user], I want to [action], so that [benefit]," with acceptance criteria, priority, story points, and technical tasks.

Include core features such as authentication, profiles, job/internship search and posting, applications, messaging, networking, notifications, resume management, and innovative features like AI Career Match, Skill Gap Analysis, Career Readiness Score, GitHub portfolio integration, and personalized career roadmaps.

Organize the stories into a prioritized backlog for Sprint 1, Sprint 2, and future releases, identify dependencies and PostgreSQL entities, and highlight the 3 most innovative yet realistic features for a university software engineering project.

AI Usage Log: Entry #02

Task: Sprint 1 planning and deliverables

Purpose of AI Use: Sprint planning, documentation support, and task decomposition

Chat Link: [Organize Sprint Deliverables]

AI-Suggested Content: Helped organize Sprint 1 deliverables such as feature lists, user stories, sprint planning, README instructions, and database entity considerations.

Validation: Cross-checked proposed deliverables against the Sprint 1 instructions discussed in chat. Repository evidence and final submission status should be confirmed separately.

Decision: Retained relevant planning suggestions for team review and adaptation.

Reflection: AI was useful for organizing requirements but could not independently confirm the team completed every deliverable.

Responsible Person: Candys Eve Mekoupou Eko

Prompt:

I am working on CareerConnect-GroupA for SOEN 341 Software Process at Concordia University.

Help me organize and complete the Sprint 1 deliverables according to the official project requirements.

Review the planned CareerConnect features, including authentication, student profiles, resume management, job postings, job applications, messaging, and career networking.

Help me prepare:

1. *A prioritized product backlog with at least 15 user stories and acceptance criteria.*
2. *A Sprint 1 plan with tasks, responsibilities, and priorities.*
3. *A feature list describing the main functionalities.*
4. *A PostgreSQL database entity relationship design.*
5. *GitHub Issues and technical task breakdowns.*
6. *README documentation with installation and execution instructions.*
7. *Two demonstrable application features.*
8. *A checklist to verify that all required deliverables are ready.*

Explain the purpose of each deliverable and how it contributes to Sprint 1. Do not assume that a deliverable has been completed without verification.

AI Usage Log: Entry #03

Task: Frontend profile development support

Purpose of AI Use: Programming guidance and interface design

Chat Link: [Organize Sprint Deliverables]

AI-Suggested Content: Provided guidance for React, TypeScript, Vite, and profile editing workflows, including Personal, Professional, and Links sections and edit, cancel, and save states.

Validation: Reviewed development commands and user-reported local UI behavior during troubleshooting. Full acceptance testing is not established by these discussions alone.

Decision: Applied or considered suggestions while developing the frontend; final code should be verified against repository commits.

Reflection: AI helped explain frontend state and development workflow. Human testing was needed to confirm usability and persistence.

Responsible Person: Candys Eve Mekoupou Eko

Prompt:

I am developing the frontend of CareerConnect using React, TypeScript, Vite, and Tailwind CSS.

Help me implement a professional user profile interface with three sections: Personal Information, Professional Information, and Links.

The profile should support viewing and editing information, with Edit, Save, and Cancel buttons.

Explain how React components, useState, event handlers, and conditional rendering work.

Guide me step by step through the frontend project structure, including App.tsx, Profile.tsx, index.css, and main.tsx.

Provide the commands needed to install dependencies and run the Vite development server.

Help me troubleshoot compilation errors, rendering problems, and state management issues. Explain how to verify that the profile interface works correctly and distinguish frontend state updates from information actually saved to the backend.

AI Usage Log: Entry #04

Task: Backend setup and authentication troubleshooting

Purpose of AI Use: Development environment setup and debugging

Chat Link: [Organize Sprint Deliverables]

AI-Suggested Content: Explained Python FastAPI, SQLModel, development database initialization, dependency setup with uv, and authentication API testing.

Validation: User reported a working backend documentation page and successful registration request. Broader authentication security testing was not independently verified.

Decision: Used guidance to progress local backend setup and understand API behavior.

Reflection: AI accelerated troubleshooting but terminal results and API responses provided the meaningful evidence.

Responsible Person: Candys Eve Mekoupou Eko

Prompt:

I am setting up the CareerConnect backend for SOEN 341 using Python, FastAPI, SQLModel, JWT authentication, and SQLite for local development.

Guide me through configuring the backend environment, installing dependencies using uv, initializing the database, and starting the FastAPI development server.

Explain the purpose of the main backend files, including main.py, database configuration, models, and authentication routers.

Help me troubleshoot installation errors, import problems, database initialization errors, and server startup issues.

Show me how to access the FastAPI Swagger documentation at /docs and test the /api/auth/register and /api/auth/login endpoints.

Explain how to interpret HTTP responses, including 201 Created, authentication failures, and validation errors.

Provide step-by-step PowerShell commands and explain how to verify that the backend is functioning correctly.
