CareerConnect | AI Usage Log | Sprint 3

Responsible Person: Candys Eve Mekoupou Eko

Project: SOEN 341, CareerConnect-GroupA

Documentation basis: AI-assisted work discussed in ChatGPT. Review each entry and add direct chat links and repository evidence before submission. These entries do not claim actions or outcomes that were not confirmed.

AI Usage Log: Entry #01

Task: Recruiter Dashboard and applicant management, US-10.02, issue #122

Purpose of AI Use: Frontend and backend programming guidance, debugging, and testing

Chat Link: N/A

AI-Suggested Content: Assisted with recruiter dashboard navigation, job creation and editing, closing and reopening postings, applicant details, secure PDF resume viewing, and application status updates.

Validation: User reported manual testing with a job and applicant, successful resume viewing, and a persisted status update. Verification is based on user-shared results.

Decision: Integrated implementation guidance into feature development and prepared the feature branch for pull request review.

Reflection: AI helped trace interactions across UI, API, and authorization. Manual testing revealed whether workflows behaved as expected.

Responsible Person: Candys Eve Mekoupou Eko

Prompt:

I am working on CareerConnect-GroupA, a SOEN 341 project at Concordia University.

Help me complete GitHub issue #122, Recruiter Dashboard, using the existing React frontend and FastAPI backend.

Review the existing code before making changes to avoid duplicating teammates' work.

Guide me through recruiter dashboard navigation, creating and managing job postings, viewing applicants and resumes, and updating application statuses.

Provide step-by-step PowerShell commands, explain necessary code changes, help resolve Git conflicts, and verify the frontend build and backend tests before preparing a pull request.

AI Usage Log: Entry #02

Task: Merge conflict resolution and regression testing for issue #122

Purpose of AI Use: Version control troubleshooting and quality assurance

Chat Link: [CareerConnect]

AI-Suggested Content: Guided merging recent main changes into the recruiter dashboard branch, resolving App.jsx conflicts, preserving analytics and interview routes, and preparing a pull request summary.

Validation: User reported successful merge and push. Frontend production build succeeded, and the backend test suite reported 72 passing tests. GitHub Actions CI verification was not confirmed.

Decision: Retained the resolved integration and documented verified local tests without claiming CI success.

Reflection: AI provided a structured conflict resolution process, while Git and test outputs determined actual success.

Responsible Person: Candys Eve Mekoupou Eko

Prompt:

I am working on CareerConnect-GroupA, my SOEN 341 Software Process project at Concordia University.

I have been implementing GitHub issue #122, Recruiter Dashboard, using React and FastAPI.

Help me synchronize my feature branch with the latest main branch and resolve any merge conflicts without losing my work or my teammates' contributions.

Pay particular attention to App.jsx and preserve the existing application routes, including analytics, interview preparation, authentication, and recruiter dashboard navigation.

Guide me step by step using PowerShell commands to:

1. *Check my current Git branch and working tree.*
2. *Fetch the latest changes from GitHub.*
3. *Merge the updated main branch into my feature branch.*
4. *Identify and resolve merge conflicts.*
5. *Verify that all existing features remain functional.*
6. *Run the frontend production build and backend tests.*
7. *Commit and push the resolved changes.*
8. *Prepare a pull request description for GitHub issue #122.*

Explain each command, help me interpret terminal errors, and do not claim that tests or GitHub Actions succeeded unless the outputs confirm it.

AI Usage Log: Entry #03

Task: AI Suggested Postings UI planning, US-15.02, issue #136

Purpose of AI Use: Requirements analysis, code inspection, and API integration planning

Chat Link: [CareerConnect]

AI-Suggested Content: Reviewed issue #136 and parent issue #58. Identified the required Suggested Postings option in the Sort by dropdown and recommendation explanations on job cards. Inspected existing job-search components and API calls.

Validation: Read user-shared Git searches and source excerpts. No recommendation implementation was detected by the searches; the backend dependency issue #135 was reported as blocked.

Decision: Deferred final API integration until the backend developer confirms the endpoint and response schema. No completed US-15.02 implementation is claimed.

Reflection: AI was useful for mapping integration points and preventing duplicate backend work. Coordination is necessary before connecting UI behavior to an API.

Responsible Person: Candys Eve Mekoupou Eko

Prompt:

I am working on US-15.02: Suggested Postings UI, GitHub issue #136, for CareerConnect-GroupA.

The parent issue is US-15: AI Suggested Postings #58, and my task depends on US-15.01: Suggested Postings Backend #135, assigned to another teammate.

Before writing code, help me inspect the existing implementation and identify the frontend integration points.

The acceptance criteria are:

1. *Users can select "Suggested Postings" from the existing "Sort by" dropdown.*
2. *Suggested job postings display explanations for their recommendations, such as matching skills, desired salary, location, or working hours.*

Review the following files:

- *JobSearchPage.jsx*
- *JobSearchPageNavbar.jsx*
- *src/frontend/src/api/jobs.js*
- *src/backend/routers/jobs.py*
- *src/backend/models.py*
- *src/backend/routers/auth.py*

Explain how the existing job-search functionality works, how the Suggested Postings UI should integrate with it, and what API information must be confirmed with the backend developer.

Avoid duplicating backend functionality or changing existing features unnecessarily.

Provide exact PowerShell commands for inspecting the files and clearly distinguish completed functionality from proposed functionality.

Do not claim that US-15.02 has been implemented or tested before that work is completed.

AI Usage Log: Entry #04

Task: Repository synchronization and feature branch preparation

Purpose of AI Use: Git troubleshooting and development workflow support

Chat Link: [CareerConnect]

AI-Suggested Content: Diagnosed a GitHub DNS resolution error, guided fetch and fast-forward update of main, and creation of a separate branch for AI Suggested Postings.

Validation: User-shared terminal output confirmed successful connectivity, main update to commit 8eb72ac, and creation of feat/ai-suggested-postings-58.

Decision: Kept new work isolated from the previous recruiter dashboard feature branch.

Reflection: AI guidance helped prevent accidental changes to a completed feature and reinforced safe branch management.

Responsible Person: Candys Eve Mekoupou Eko

Prompt:

I am continuing development on CareerConnect-GroupA using Git, GitHub, Windows PowerShell, and VS Code.

My previous work on Recruiter Dashboard issue #122 has been merged into main.

I now need to prepare my local repository for US-15: AI Suggested Postings #58 without modifying or losing the completed recruiter dashboard implementation.

Help me:

1. *Check my current branch and working tree.*
2. *Diagnose the Git error "Could not resolve host github.com".*
3. *Verify DNS resolution and HTTPS connectivity to GitHub.*
4. *Fetch the latest remote branches and remove stale remote-tracking references.*
5. *Switch safely to main.*
6. *Update main using git pull --ff-only origin main.*
7. *Create a new feature branch named feat/ai-suggested-postings-58.*
8. *Verify that the new branch contains the latest changes from main.*

Explain the purpose of each Git command and guide me through troubleshooting based on my actual terminal output.

Do not recommend force-pushing, deleting unfinished work, or overwriting teammates' changes.
