

AI Usage Log: Entry #01 (Doryan Gonin)

Task #16: Define User Stories

Purpose of AI Use:

Brainstorming, requirement analysis, and documentation

Chat Link: <https://share.gemini.google/O4Eib6Om9Sv8>

AI-Suggested Content:

Generated 10 user stories in accordance with the initial requirements

Validation:

Reviewed each user story individually and assured they were in accordance with project requirements as well as our expectations.

Decision:

Output was minimally reworded (for clarity) before acceptance. Note that the given subtasks will be adapted when adapting the workflow and the requirements as we go

Reflection:

AI gave well thought and relevant User Stories. The prompt included an additional category about "context" that was not included in the User Stories for the sole purpose of understanding the reasoning behind each user story and help us validate them.

The given subtasks are a great starting point but lack the depth and context of our team's workflow (which is understandable given the lack of precision on this point in the prompt).

Responsible Person: Doryan Gonin

Note: Each user story is provided in this document as given by the AI for ease of access.

US-01 - User Registration and Authentication

Narrative: As a job seeker, I want to create an account and log in securely so that I can access personalized features like saving jobs and applying.

Context: This is the standard entry point for the web platform. It ensures data privacy, allows the system to identify the user, and secures personal information like resumes and contact details.

Acceptance criteria:

- The signup form validates email formats and enforces strong password requirements.
- Users can successfully log in with correct credentials and are blocked after multiple failed attempts.
- Users receive a welcome confirmation email upon successful registration.

Subtasks:

- Design the user interface for the signup and login pages.
 - Implement user database schemas for secure credential storage.
 - Set up authentication and session management logic.
 - Create success, error, and validation messages for the forms.
-

US-02 - Candidate Profile Management

Narrative: As a registered user, I want to create and edit my professional profile so that I don't have to re-enter my basic information for every single job application.

Context: Saving the user's time during the application process is crucial for a positive candidate experience. It also provides recruiters with standardized, easy-to-read data.

Acceptance criteria:

- Users can input and edit their name, contact info, education, and work history.
- Changes made to the profile are saved instantly and reflect immediately on the interface.
- Profile data automatically populates into standard application forms when the user clicks "Apply."

Subtasks:

- Create the profile creation and editing user interface.
 - Implement the save functionality to update user records in the database.
 - Link the saved profile data to the job application module.
-

US-03 - Resume Upload and Management

Narrative: As a job seeker, I want to upload and manage multiple versions of my resume so that I can quickly tailor my applications to different types of roles.

Context: Candidates rarely use just one generic resume. A flexible document management system is key to helping them put their best foot forward for specific opportunities.

Acceptance criteria:

- The system accepts PDF and DOCX file formats.
- The file upload size is capped at a maximum of 5MB per document.
- Users can view, download, delete, and set a "default" resume from their file list.

Subtasks:

- Build the drag-and-drop file upload interface.
- Configure secure file storage architecture.
- Implement file type and size validation logic.
- Build a document list view with management actions (delete, download, default)

US-04 - Job Search and Filtering Capabilities

Narrative: As a job seeker, I want to search for jobs by keywords and filter them by location and salary so that I can quickly find open roles that match my specific needs.

Context: This is the core exploratory function of the platform. Without a robust and accurate search, users will get frustrated and leave the platform before applying.

Acceptance criteria:

- The main search bar accepts keywords matching job titles, skills, or company names.
- Sidebar filters are available for remote/onsite, salary range, and date posted.
- The job list updates dynamically when a new filter or search query is applied.

Subtasks:

- Design the search bar and filter sidebar interface.
 - Implement the search query logic to fetch matching jobs.
 - Design the job results list layout and individual job cards.
 - Build an "empty state" interface for when no jobs match the criteria.
-

US-05 - Saved Jobs and Favourites

Narrative: As a job seeker, I want to bookmark job postings I am interested in so that I can easily find them later when I have time to fill out the application.

Context: Candidates often browse job boards on mobile devices or during short breaks, preferring to actually apply later on a desktop. Bookmarking bridges this gap and prevents lost opportunities.

Acceptance criteria:

- Users can click a bookmark icon on any job card to save it.
- Saved jobs appear immediately in a dedicated "Saved Jobs" tab in the user's profile.
- Users can remove jobs from their saved list by unclicking the bookmark icon.

Subtasks:

- Create the save/unsave toggle user interface on job cards.
 - Build the database relationship linking a specific user to specific job IDs.
 - Create the dedicated view/page for displaying the saved jobs list.
-

US-06 - Job Application Submission

Narrative: As a job seeker, I want to submit my application directly through the platform so that I don't have to navigate to clunky external company websites.

Context: Keeping the user on the platform reduces friction in the application process, leading to much higher application completion rates for recruiters.

Acceptance criteria:

- The application form requires a resume attachment before submission is allowed.
- A successful submission triggers an on-screen confirmation message.
- The system instantly routes the submitted application data to the corresponding recruiter's dashboard.

Subtasks:

- Build the application form interface (modal or dedicated page).
- Implement the submission logic connecting the user to the job posting.
- Design the success confirmation interface.

US-07 - Application History Dashboard

Narrative: As a job seeker, I want to view a list of all the jobs I have applied to so that I can keep track of my active job search efforts.

Context: Candidates often apply to dozens of jobs and easily lose track of where they have sent their resume. A centralized dashboard organizes their search and reduces cognitive load.

Acceptance criteria:

- The dashboard displays a table or list view of all submitted applications.
- Each entry shows the job title, company name, and the date of submission
- The list is sorted chronologically by default, with recent applications at the top.

Subtasks:

- Design the dashboard layout for candidates.
 - Implement logic to query the database for a user's past applications.
 - Build the list/table user interface to display the fetched data.
-

US-08 - Application Status Tracking

Narrative: As a job seeker, I want to see the current status of my submitted applications so that I know exactly where I stand in the hiring process for each company.

Context: The "black hole" of job applications (never hearing back) is a major candidate pain point. Status visibility reduces anxiety, improves transparency, and builds trust in the platform.

Acceptance criteria:

- Clear status badges (Applied, Interview, Offered, Rejected) are visible next to each job on the history dashboard.
- Statuses update in real-time when changed by the recruiter.
- Statuses are visually color-coded for quick scanning

Subtasks:

- Define the status enumerations in the database architecture.
 - Design the visual status badges for the user interface.
 - Implement logic to fetch and display the most up-to-date status for each application.
-

US-09 - Notifications and Reminders for Deadlines

Narrative: As a job seeker, I want to receive an in-app notification before a saved job's application deadline expires so that I don't miss the chance to apply.

Context: This feature drives user re-engagement, bringing them back to the platform, and directly helps candidates manage time-sensitive opportunities efficiently.

Acceptance criteria:

- The system generates an alert 48 hours before the closing date of any job in the user's "Saved Jobs" list.
- The user can view and dismiss the notification from a notification center in the navigation bar.
- Clicking the notification redirects the user directly to that specific job's application page.

Subtasks:

- Design the notification bell and dropdown user interface.
- Implement a background process to regularly check job deadlines against saved lists.
- Build the logic to trigger and deliver alerts to specific users

US-10 - Job Posting Management for Recruiters

Narrative: As a recruiter, I want to create, edit, and close job postings so that I can accurately reflect my company's current hiring needs to candidates.

Context: This is essential for the supply side of the platform. Without easy-to-use recruiter tools, there are no job postings for the candidates to apply to, rendering the platform empty.

Acceptance criteria:

- Recruiters can draft a job description using a rich text editor (bolding, bullet points).
- Active postings can be manually toggled to "Closed" to immediately stop accepting new applications.
- Role-based access ensures recruiters can only edit or delete postings they created.

Subtasks:

- Build a separate recruiter dashboard interface.
- Implement the job creation form with a text editor component.
- Add edit, delete, and status toggle functionality for existing postings.
- Enforce role-based access control and security permissions.
