AI USAGE LOG & REPORT

Sprint 2 - Feature Delivery, Acceptance Testing and Continuous Integration

SOEN 341 - Software Process | Concordia University

Project: CareerConnect-GroupA

Prepared as an editable AI Usage Log and Report template

1. Purpose and objective

This document records and explains responsible generative AI use during Sprint 2 of CareerConnect-GroupA. Sprint 2 continues Sprint 1's transparency requirements and requires the team to maintain its AI_Log directory. The log should show the prompts used, outputs received, validation activities, changes made by the team, and the rationale for final decisions. Populate it with actual evidence before submission; the activity areas in this template are not claims that work has already occurred.

Sprint 2 objectives supported by AI

- Refine and integrate Sprint 1 functionality without rebuilding the project unnecessarily.
- Deliver user profile and resume management, job search/listing, and job application submission/tracking.
- Begin recruiter dashboard and job-posting management, with completion allowed in Sprint 3.
- Prepare at least two acceptance tests for every Sprint 1 and Sprint 2 user story and track them as linked GitHub Issues.
- Support CI setup, sprint planning, task breakdown, meeting minutes, contribution logs, and the one-page summary report.

2. Description: how AI may support Sprint 2

AI may assist with analyzing existing code, decomposing stories, proposing test scenarios, explaining security considerations, reviewing CI failures, and drafting documentation. All outputs must be checked against the actual codebase and the official Sprint 2 guidelines. AI must not be used to fabricate evidence or replace required team participation.

Activity area	How AI may be used	Why it is useful	Required validation
Sprint planning and backlog	Help break features into user stories, tasks, dependencies, and measurable acceptance criteria.	Makes work trackable and supports an organized sprint.	Compare with official guidelines and current issues; confirm ownership and estimates with the team.
Profile and resume management	Explain existing profile endpoints and suggest validation, replacement, listing, and access-control test cases.	Helps improve completeness and safety of file-management workflows.	Inspect implementation; test file type/size, ownership, persistence, and unauthorized access.
Job search and listings	Suggest search/filter behavior, API designs, UI states, and edge-case tests.	Helps make the feature consistent and testable.	Run queries against actual data; verify keyword, location, category, empty, and error states.
Application submission/tracking	Suggest data relationships, status validation, duplicate-submission handling, and acceptance scenarios.	Supports reliable application tracking and reduces missed edge cases.	Verify persistence, authorization, status transitions, confirmation, and duplicate behavior.
Acceptance tests	Draft preconditions, steps, test data, expected results, and negative cases for each story.	Helps make acceptance criteria executable and traceable.	Ensure at least two distinct tests exist per story; create/link issues and execute tests where possible.
CI and debugging	Explain build/test failures and suggest GitHub Actions workflow improvements.	Can reduce time spent diagnosing pipeline configuration.	Run workflow on push/PR; inspect actual logs and confirm passing checks.
AI log and final report	Help organize AI-use entries, contribution-log templates, meeting-minute formats, and report structure.	Improves traceability and helps prepare for assessment.	Use real prompts, work, dates, hours, decisions, and links only.

3. Why responsible AI use matters in Sprint 2

- Feature completeness: AI can prompt the team to consider edge cases and missing acceptance criteria.
- Test coverage: AI can help propose distinct positive and negative scenarios across every story.
- Integration quality: AI can help interpret errors, but actual builds, tests, and API behavior determine whether a fix works.
- Security awareness: AI may flag file-upload, authorization, input-validation, and data-exposure risks; the team must verify them.
- Project transparency: a complete log connects prompts and outputs to modifications, validation evidence, and final decisions.
- Individual accountability: contribution records must reflect each member's actual work, time, and repository artifacts.

4. Responsible-use and validation procedure

1. Log meaningful AI-assisted tasks when they occur rather than reconstructing the entire log at the end.
2. Keep the actual prompt or an accurate summary, a short output summary, and the final team decision.
3. Record what was modified, rejected, or accepted and why.
4. For code, inspect changes, run relevant automated tests, exercise the feature manually, and record the real results.
5. For acceptance tests, link each test issue to its story and implementation task; do not count a test as passed unless executed.
6. For CI, retain the workflow path and actual GitHub Actions run or failure evidence.
7. For meeting minutes and contribution logs, use actual attendees, dates, hours, and contributions; never invent records.
8. Avoid exposing secrets or private data to AI tools, and comply with all course restrictions on AI assistance.

5. Sprint 2 AI-use summary

Item	**Team's verified record**
AI tools used	[Enter only tools actually used]
Features/tasks assisted	[Profile/resume, jobs, applications, recruiter foundation, CI, tests, docs]
Prompts and generated outputs	[Link or summarize actual prompts and outputs]
Team modifications	[Explain what was changed, integrated, or rejected]
Validation evidence	[Test results, build logs, CI runs, code reviews, manual checks]
Final decisions and rationale	[Explain why the team adopted or rejected suggestions]
Repository evidence	[GitHub issue/PR/commit/workflow/document links]
Team member responsible	[Name and actual contribution]

AI usage log — entries to complete

Use this table to record each actual AI-assisted activity. The example activity areas below are prompts for documentation, not claims that the team performed the activity. Replace placeholders with the real date, tool, prompt, output, validation, modifications, decision, and evidence. Delete any row that did not occur.

Date / team member	Task & AI tool	Prompt / purpose	Output & team changes	Validation & evidence
[YYYY-MM-DD] / [member]	Sprint planning / story breakdown	[Actual prompt and tool]	[Story/task changes adopted]	[Guideline check; issue links]
[YYYY-MM-DD] / [member]	Profile/resume implementation	[Actual prompt and tool]	[Changes accepted, edited, or rejected]	[Actual tests and file links]
[YYYY-MM-DD] / [member]	Job search / application tracking	[Actual prompt and tool]	[Implementation or test changes]	[API/UI test evidence]
[YYYY-MM-DD] / [member]	Acceptance tests	[Actual prompt and tool]	[Test scenarios revised by team]	[Linked issues and actual results]
[YYYY-MM-DD] / [member]	CI / debugging	[Actual prompt and tool]	[Workflow or fix changes]	[GitHub Actions run URL and result]
[YYYY-MM-DD] / [member]	Report / meeting minutes / contribution log	[Actual prompt and tool]	[Document sections edited]	[Repository path and factual review]

6. Sprint 2 feature and evidence tracking

Requirement	AI assistance recorded?	Validation evidence / status
Profile and resume management	[Yes/No; only if true]	[Tests, issue/PR, result]
Job search and job listing interface	[Yes/No; only if true]	[Search/filter/detail checks]
Application submission and tracking	[Yes/No; only if true]	[Submission/status/authorization checks]
Recruiter dashboard foundation	[Yes/No; only if true]	[Posting/application-viewing evidence]
Acceptance tests: 2+ per story	[Yes/No; only if true]	[Story inventory and linked test issues]
Continuous Integration	[Yes/No; only if true]	[Workflow path and run link]
Meeting minutes and contribution logs	[Yes/No; only if true]	[Repository paths and verified records]
One-page Sprint 2 report	[Yes/No; only if true]	[Final report path]

7. Sprint 2 reflection and follow-up

Useful AI contributions: [Verified examples].
Incorrect or unsuitable suggestions: [Actual examples and how they were handled].
Validation and modifications: [Actual evidence].
Improvements for future sprints: [Specific changes to prompting, review, testing, or logging].

8. Evidence checklist before submission

- AI_Log directory from Sprint 1 is maintained rather than replaced.
- Meaningful AI uses include prompts, output summaries, modifications, validation, and rationale.
- Code claims are supported by actual tests/builds or are clearly marked unverified.
- Acceptance-test issues are linked to the corresponding stories and tasks.
- CI evidence comes from the actual repository workflow.
- Meeting minutes and contribution logs reflect real events and work.
- One-page report matches verified implementation and contribution evidence.
- All repository links are checked and course AI policies are followed.
